

Partial list of DokuWiki plugins used:

- 01) clear history
- 02) fontface (used to set up better fonts)
- 03) move (renames pages)
- 04) ocimage (OldCoder plugin discussed below)
- 05) page redirect (used to redirect pages)
- 06) page title
- 07) skipentity
- 08) wrap (used to make the boxes)

The “move” plugin is supposedly risky to use. However, it seems to work fine for simple sites.

This DokuWiki provides source-code archives for the external plugins used in a subdirectory named “src”.

Partial list of other DokuWiki changes:

- 09) Theme is a fork of “Mind The Dark”
- 10) Text is justified (using “wrap”)
- 11) Primary font is Merriweather (using “fontface”)
- 12) We've started to add soft hyphens
- 13) Revision history is reset manually periodically
- 14) Search box is hidden (it's not that useful)
- 15) Revision history is usually hidden
- 16) Search engines are enabled but archiving is disabled
- 17) Search-engine friendly URLs are used
- 18) Search engine index delay is disabled
- 19) A superfluous security warning has been patched out

Some of these changes are discussed further below.
